

Durability Index Agitator

Features:

- Optimal for measuring relative resistance of aggregates to abrasion during agitation
- Ability to use a sieve shaker for up to six full-height 8in or 200 diameter sieves and pan

Includes:

- Holes in Case Flanges for Securing to Floor/Bench
- Switch
- Cord
- Flug
- Timer and wash vessel sold separately
- Stainless Steel Wash Vessel comes complete with lid, gasket and clamp

The Durability Index measures the relative resistance of aggregates. It produces clay-like fines when mechanically agitated in a special washing vessel. The resulting fines material is evaluated using the sand equivalent apparatus that is sold separately. The machine runs at 285cpm. It can also be used as a sieve shaker for up to six full-height 8in or 200mm diameter sieves and pan. Holes are provided on the unit, giving the option for securing flanges to the floor or a bench.
